

WEEK 4 · COURSE 4

Advanced Workshop

From individual capability to organizational capability — map the frontier, ship a complex build, debug together, teach others.

LENGTH

4 hours (with one 10-min break)

FORMAT

Microsoft Teams workshop — bring builds in progress

PREREQ

At least one deployed tool

SPEAKER NOTES

Open the meeting on this slide and wait 30 seconds while people join. When you start, low-energy and direct: “Welcome to Week 4. This is the workshop. The next four hours look different from the first three weeks — I’m going to talk less, you’re going to do more.”

Confirm the prereq out loud: **everyone in this room has at least one tool deployed.** If anyone doesn’t, name it kindly and tell them they should be in Platform Training instead.

Time on slide: 90 seconds. Click forward when you’ve confirmed the room is set.

Welcome — this is a workshop, not a lecture

How today is going to feel different from Weeks 1-3

What you do

- Cameras on when you can
- Have your tool open in another window
- Bring at least one real problem to debug
- Drop questions in chat live — we'll surface them
- Be ready to share screen on short notice

What I do

- Talk less, watch more
- Hold time on every activity
- Surface patterns out loud as I see them
- Refuse to fix your problem for you — coach you through it
- Capture frontier findings to share back to the unit

SPEAKER NOTES

Set the workshop tone explicitly. Read the right-hand column out loud first — people need to hear that you're refusing to fix their problems for them. Then walk the left column.

Make the chat ask concrete: "Drop one thing you're hoping to leave with today in chat right now." That gets the chat warm so it stays warm during workshops.

Time on slide: 3 minutes. Total 0:00-0:05.

You're here because you've already done the work

Recap — what you brought into this room

WEEK 1

AI Fluency Fundamentals

The six 201 skills, the jagged frontier, centaur vs. cyborg, the management framing.

WEEK 2

Builder Orientation

Your first prototype. Task decomposition and iterative refinement applied to a real problem.

WEEK 3

Platform Training

Three complete tools on Power Platform, deliberately switching between centaur and cyborg work.

Required to be here: at least one tool you have actually deployed and somebody else is using.

SPEAKER NOTES

Don't re-teach the prior weeks — just remind. 30 seconds per card. Land the punchline: **you're here because you've already done the work**. The room earned its way in.

If somebody says they haven't deployed a tool, redirect kindly to Platform Training. Don't shame; just protect the workshop.

Time on slide: 2 minutes.

What today is for

The shift from individual capability to organizational capability

You've been here

- Built a tool
- Made it work for you
- Solved your own problem
- Learned a few things the hard way

You're going here

- Map the frontier for your domain so others don't fall in
- Ship something complex on purpose, not by accident
- Debug other people's tools, not just your own
- Build a QA habit you can hand to a junior Marine
- Teach the 201 skills forward

SPEAKER NOTES

Frame the shift: **individual capability → organizational capability**. That sentence is the spine of the whole day. Say it twice.

Name the implicit promise: "By the end of today, the things in your head become things your section can use without you in the room." That's the "graduated" bar.

Time on slide: 2 minutes.

Agenda — 4 hours

Workshop blocks are gold-coded throughout the deck

Time	Module	Duration	Mode
0:00-0:30	M1 — Frontier mapping for your domain	30 min	Workshop
0:30-1:30	M2 — Complex build (Unit Readiness Dashboard)	60 min	Live build
1:30-1:40	Break	10 min	—
1:40-2:20	M3 — Group debugging (real problems)	40 min	Clinic
2:20-2:50	M4 — Verification protocols and QA	30 min	Reference + drill
2:50-3:20	M5 — Teaching others (teach-back)	30 min	Workshop
3:20-3:50	M6 — Workflow playbook	30 min	Workshop
3:50-4:00	Wrap-up, certification, Week 5 preview	10 min	—

SPEAKER NOTES

Walk the agenda, but spend most of the time on the **workshop blocks** (gold rows). Tell the room: “When you see a gold-coded slide, that’s your cue to stop watching and start working.”

Confirm the break time — people will plan around it. **One break, 10 minutes, hard time.**

Time on slide: 3 minutes. Aim to enter Module 1 at 0:10.

MODULE 1

Frontier mapping for your domain

30 minutes

Make the boundary between “AI helps” and “AI hurts” visible — for your specific work, in writing, shareable.

SPEAKER NOTES

Pause on this slide for 5 seconds before talking. Section dividers are a visual reset for the room.

Land the timing: “30 minutes total. 5 minutes of context, 15 minutes of silent work, 10 minutes of share-out.”

Module 1 starts at 0:10. End at 0:30.

Why this map is the most valuable thing you'll make today

—19pp

Performance drop when consultants used AI on tasks *outside* the frontier — vs. working without AI at all.

BCG · Harvard, 758 consultants, 2023

What that means today

- The boundary is real, and it's not where intuition puts it.
- People don't notice when they cross it.
- Quality collapses silently — the output still *looks* right.
- The map is what makes the boundary visible to your section.
- Most valuable artifact you'll leave with today.

SPEAKER NOTES

Lead with the stat. Read the —19pp number out loud, then the source. Say: “That’s the most important number in this whole day.”

The right column is the unlock: **quality collapses silently — the output still looks right.** That’s why the map matters: it’s the only way to know where you’re standing.

Time on slide: 3 minutes.

Worked example — 1st Bn, 99th Marines

A frontier map looks like this. Yours will look like this.

Category	Inside frontier (AI handles)	Outside frontier (AI fails)	Moving frontier (re-test)
Document generation	Counseling drafts, award write-ups, memo formatting	Local SOPs, exact regulation quotes, unit-specific policy	Fitness report narratives, legal review summaries
Data analysis	Trend ID in clean data, dataset summaries, anomaly flagging	Operational interpretation (“why did readiness drop?”)	Predictive analysis — retention, maintenance forecasting
Process automation	Approval routing, notifications, status tracking	Multi-system integrations with legacy DBs, judgment calls (hardship)	Complex conditional workflows with clear business rules
Reference lookup	Finding MCOs/NAVMCs, summarizing policy docs	How a regulation applies to <i>this</i> edge case	Authoritative interpretation — still unreliable
Training development	Lesson outlines, quiz generation, slide structure	Effectiveness evaluation, MOS-specific accuracy	Full lesson plan generation — quality varies

SPEAKER NOTES

Walk one row out loud as a model — **Document generation** works well. Show how each cell is a real, specific task.

Don't read the whole table. Say: "Yours is going to look like this. Look how specific each cell is."

Time on slide: 3 minutes.

What good looks like

Before you start typing — here's the bar

Specific, not generic

- **Bad:** “writing”
- **Good:** “counseling statement drafts for Page 11 entries”
- Each cell is a real task somebody on your team does this month.

Tested, not guessed

- Every “outside frontier” entry should be something you actually saw fail.
- If your “outside” column is empty, you're overestimating AI.

Per tool, not in general

- GenAI.mil and CamoGPT have different frontiers in your domain.
- Note which tool the entry applies to.

Living, not finished

- “Moving frontier” entries get re-tested next quarter.
- Date the map. Initial it. Hand it off when you PCS.

SPEAKER NOTES

This is the “before you start typing” slide. Hit the four bars: specific, tested, per-tool, living.

Land hard on: **“If your outside-frontier column is empty, you're overestimating AI.”** Most people's first draft has an empty “outside” column — flag it now so they don't leave it blank.

Time on slide: 2 minutes. Move into the workshop at 0:18.

Build your frontier map — right now

15 minutes • silent work, then share-out

PROMPT

Open a blank doc. Make four columns: **Category** • **Inside** • **Outside** • **Moving**. Pick **five categories** that cover what your section actually does this month. Fill at least one specific, real example in every cell — tasks you have personally seen succeed or fail.

What good looks like in 15 minutes: 5 rows, every cell has at least one specific task (not a topic), and your “outside frontier” column is not empty. If you’re stuck, look at your last 30 days of work and ask: where did AI save me time, and where did it cost me time?

SPEAKER NOTES

This is a hard timebox: 15 minutes silent work. Set a visible timer (Teams or your phone). Mute yourself once you’ve set the timer.

Read the prompt out loud once. Repeat it once. Say nothing else for 30 seconds — let the silence settle the room into work.

At the 7-minute mark, drop a chat message: **“Halfway. If your ‘outside frontier’ column is still empty, that’s the column to fill now.”**

At 13 minutes: “2 minutes left.” At 15: hard stop. Move on even if people aren’t finished — the share-out is part of the learning.

Time on slide: 15 minutes (0:18-0:33). Note: this is 2 minutes long against the 30-minute module — cut share-out by 1 minute and start the divider for M2 cleanly at 0:33. We absorb 3 min into the M2 60-minute block.

Share-out — round the room

10 minutes · 90 seconds each · we are listening for patterns

What to share

- One *inside-frontier* task that surprised you (AI is better at this than you thought).
- One *outside-frontier* task you have personally seen fail.
- One thing you'd add to the “moving frontier” column that you want to re-check next quarter.

What I'm capturing in chat

- Failure cases — these become unit-wide frontier intel.
- Cross-tool differences (GenAI.mil vs. CamoGPT).
- Anything 2+ people independently discovered.

Hard stop at 10 minutes. If we don't get to you, drop your map in chat.

SPEAKER NOTES

Hard timebox: 10 minutes. 90 seconds per person. Use a list of names so you don't accidentally only call on the loudest hands.

Drop in the chat as people share: **“Failure case captured: [thing].”** This is how you build the unit-wide frontier intel asset, and people see it happening live.

If 2+ people independently report the same failure, call it out: “That's a pattern — on the unit map.”

Hard stop at 10 minutes. “If we didn't get to you, drop your map in chat — I'll fold it in.”

Time on slide: 10 minutes (0:33-0:43, drifted +3 min from agenda).

Module 1 — takeaway

The frontier map is the artifact that prevents the 19-point performance drop. When you can name where AI fails in your domain, you stop trusting it there — and you stop the rest of your section from trusting it there too.

Keep your map. Date it. Share it back to your unit by EOW.

Coming up next: a build hard enough that you'll have to deliberately switch modes *three times*.

SPEAKER NOTES

Read the pull-quote. That's the takeaway. Don't over-explain.

Hand the action: **date your map, share it back to your unit by EOW.** That's the homework.

Bridge into Module 2: "Now we're going to build something hard enough that you'll have to switch modes three times on purpose."

Time on slide: 90 seconds. Move into M2 divider.

MODULE 2

Complex build — multi-component system

60 minutes

Unit Readiness Dashboard. Three phases. Three deliberate mode switches. The point is the decision-making, not the polish.

SPEAKER NOTES

Pause again. Section dividers are a reset.

Set expectations: “60 minutes total. 10 minutes of pre-build framing, 45 minutes live build, 10 minutes debrief. The grade is the mode-switching, not the dashboard.” Say that line twice — people will try to perfect their dashboard.

Time on slide: 30 seconds. Enter pre-build at 0:43.

Before we touch the keyboard

The thing I'm grading is your mode-switching, not your dashboard

Mode-switching is the goal. Watch for the moments where you should slow down for accuracy and the moments where you should iterate fast. That's the skill.

- **Centaur** — you frame, AI drafts, you verify before moving on. Use it when errors compound.
- **Cyborg** — rapid back-and-forth, fail fast, feed errors back in. Use it when iteration is cheaper than verification.
- **The trap:** staying in cyborg mode for accuracy-critical work because it feels productive. It isn't.

SPEAKER NOTES

Read the pull-quote first. Then walk the three bullets — especially **“the trap.”** Most students will default to cyborg mode for everything because it feels productive. Name that trap explicitly so they can catch themselves.

Ask the room: “Where did you stay in cyborg mode last month and pay for it later?” Take 1-2 answers in voice or chat.

Time on slide: 3 minutes.

Build goal — Unit Readiness Dashboard

Power BI · pulls from three data sources · ~10 prompts · ~45 minutes

Inputs

- Training tracker (Excel)
- Equipment status (CSV from GCSS-MC, or simulated)
- Personnel roster (Alpha roster, or simulated)

Outputs

- Overall readiness % (color-coded card)
- Bar chart by company (Alpha, Bravo, Charlie, Weapons)
- Table of personnel *not* ready

You will switch modes 3 times

- **Phase 1** — Centaur (data architecture)
- **Phase 2** — Cyborg (data ingestion)
- **Phase 3** — Centaur (visualization)

If you finish, the dashboard is a bonus. The grade is the mode-switching.

SPEAKER NOTES

Walk inputs and outputs once. Don't demo the dashboard — that defeats the build.

Land the line: **"If you finish, the dashboard is a bonus. The grade is the mode-switching."** This frees the people who feel slow.

Time on slide: 3 minutes.

Three phases — map your mode switches

PHASE 1 · 15 MIN

Data architecture

CENTAUR

Why: schema errors compound. Verify before building.

- Prompt for star schema
- Verify columns exist in real data
- Decide: rename source, or map in Power Query?

Checkpoint: schema matches your actual columns.

PHASE 2 · 15 MIN

Data ingestion

CYBORG

Why: things will break. Feed errors back in.

- Generate M code per source
- It will fail — that's expected
- Paste error + actual file structure back in

Checkpoint: all three sources load clean.

PHASE 3 · 20 MIN

Visualization

CENTAUR

Why: leadership briefs from these numbers.

- DAX measure for readiness %
- Hand-calc one company — numbers must match
- Spot-check one Marine in the “not ready” list

Checkpoint: every number traces to source data.

SPEAKER NOTES

Walk all three phases at the conceptual level — **why this mode for this phase**. Don't walk every prompt; the instructor guide has the prompt sequences.

Land each “Checkpoint” line. Those are the verification gates. Tell the room: **“If your checkpoint fails, stop. Don't move to the next phase.”**

Time on slide: 4 minutes. Total pre-build framing: 0:43-0:53. Hand to live build at 0:53.

SWITCH · LIVE BUILD

Open Power BI · share screen if asked

You have **45 minutes**. I will walk the room.

Type your phase number in chat when you switch modes — **P1 · P2 · P3**.

If you finish early: help your neighbor. Don't polish.

SPEAKER NOTES

This slide is the explicit handoff. Read it out loud and then **shut up**. Switch your camera off if you can — signals that you're moving from front-of-room to walking-the-room.

Set a 45-minute timer visible to the room. Drop the timer link in chat.

Walk the room: pop into individual breakouts or DMs. Watch for people stuck in cyborg mode on Phase 1 (the most common failure). Coach with a question, not a fix: **"What mode are you in right now? Is that the right mode for this phase?"**

At 35 minutes: chat-broadcast **"10 minutes left. If you're still in Phase 2, that's fine — you'll learn from the debrief either way."**

At 45 minutes: hard stop. Bring the room back. Move to the debrief slide.

Time on slide: 45 minutes (0:53-1:38). This puts the break starting 8 min late vs. agenda — trim debrief if you need to recover.

Welcome back — debrief

10 minutes · volunteers, then anyone I haven't heard from yet

- Where did you switch modes? Why *there*?
- Where did the AI fail? Was it a frontier issue, a context issue, or a platform quirk?
- If you had to build this again tomorrow, what would you do differently?
- How long did it take you? How long would it have taken without AI?

*10 prompts. 3 mode switches. At least 2 error-recovery cycles. **That's normal.** The students who finished are the ones who verified at each phase boundary and fed errors back in.*

SPEAKER NOTES

10-minute debrief. Don't use all four questions if you're tight on time — pick Q1 and Q2.

Surface the patterns out loud: "Three of you said Phase 2 broke and you switched modes — that's exactly the muscle we're building."

Read the pull-quote to close. **3 mode switches, 2 error-recovery cycles — that's normal.** Reframes "I struggled" as "I did the work."

Time on slide: 8-10 minutes (1:38-1:46/1:48).

Module 2 — takeaway

Complex builds aren't harder because the prompts are harder. They're harder because you have to keep changing how you work with the AI. The skill we're grading is noticing the moment you should switch modes — and actually switching.

Time for a 10-minute break. We come back at the time on the clock, not the time you sit down.

SPEAKER NOTES

Read the pull-quote. Bridge to break.

Set the break time explicitly — **“10 minutes from the time on screen, not the time you sit down.”**

Drop the resume time in chat.

Time on slide: 60 seconds.

BREAK

10 minutes · back at the time on screen

SPEAKER NOTES

Mute your mic. Camera off. Set a 10-minute timer visible on screen if you can.

Use the break to skim the chat from M1 share-out and pull 2-3 frontier-map findings you can refer back to during M3 debugging.

Time on slide: 10 minutes (1:48-1:58). Aim to be back live at 1:58.

MODULE 3

Group debugging — real problems

40 minutes

You brought broken tools. We're going to fix the diagnostic pattern, not the tool. 5 problems · 7 minutes each.

SPEAKER NOTES

Welcome people back briskly — don't restart from cold. **"You brought broken tools. We're going to fix the diagnostic pattern, not the tool."**

Set expectations: "5 problems, 7 minutes each. We will not fully fix everything. The pattern is the deliverable."

Time on slide: 90 seconds.

Debugging clinic protocol

Same four steps for every problem · 7 minutes total · this slide stays up

STEP 1 · 2 MIN

Student presents

Format: “Expected behavior ... Actual behavior ... Steps I’ve already taken.” No story-telling. No theories. Just those three lines.

STEP 2 · 3 MIN

Group diagnosis

Group asks clarifying questions and proposes hypotheses. I’ll prompt: data or logic? input or output? Have we seen this pattern before?

STEP 3 · 2 MIN

Instructor synthesis

I name the root cause category — *frontier limitation, missing context, wrong assumption, integration failure, data quality* — and how to approach the fix.

STEP 4 · IN CHAT

Document the pattern

The failure case goes on the collective frontier map — even if we didn’t fully fix it. The pattern is the deliverable, not the fix.

SPEAKER NOTES

This slide stays on screen for the first problem so people can see the structure as you run it.

Walk the four steps. Be explicit: **“Step 1 is two minutes. If your story takes longer than two minutes, I’ll cut you. It’s for the room’s benefit, not against you.”**

Ask for the first volunteer. If nobody volunteers in 10 seconds, call on someone you saw in the M2 build who had an interesting failure.

Time on slide: 3 minutes intro + the protocol stays visible during clinics. Move to facilitation slide between problems if pace allows.

Facilitation rules — for the room and for me

When someone shares a real problem · how to keep it inclusive · when to cut it

MAKE IT SAFE TO SHARE

- Praise the broken tool out loud — this is the most useful thing you brought.
- Never let “you should have known” into the chat.
- Reframe blame as pattern: “That’s a context-gap pattern, not a you-pattern.”
- Ask the presenter what kind of help they want before the group jumps in.

KEEP IT INCLUSIVE

- Call on different people each round — not just the loudest hand.
- Quiet folks: invite them by name for clarifying questions, not solutions.
- Run hypotheses in chat in parallel with voice — gives introverts a lane.
- Two-question max per group member per problem.

WHEN TO MOVE ON

- Hard stop at 7 minutes. Set a visible timer.
- If we name the root-cause category, that’s a win — even unfixed.
- If the group is rabbit-holing on syntax, I cut it: “Pattern named, post fix in chat after class.”
- Aim for 5 problems in 35 minutes. Save 5 minutes for synthesis.

SPEAKER NOTES

This is for **you** as much as for the room. The three columns are your facilitation playbook.

Read the “Make it safe” column out loud to the room — sets the cultural tone before the first problem hits.

Use the “Keep it inclusive” rules silently. Have a name list.

Use the “When to move on” rules visibly — with a timer the room can see. The cut is easier when it’s the timer that ends the problem, not you.

Time on slide: 1-2 minutes if you treat it as a content slide; otherwise glance at it between problems.

Backup scenarios — if the room is light on real problems

Use one of these to fill the queue. Full write-ups in the instructor guide.

Scenario A — Stale data in flow

Power Automate fires on update, but the email always has the *old* values.

Pattern: platform timing quirk — not a frontier issue.

Scenario C — Dashboard shows stale data

Power BI scheduled refresh “completes successfully” but nothing updates.

Pattern: domain knowledge — data source pointed at a local C:\ path, not SharePoint URL.

Scenario B — Form saves invalid data

Power Apps phone-number validation “works,” but the submit button still accepts “abc123.”

Pattern: context gap — AI wasn’t told the button must respect the validation state.

Notice the through-line

All three look like AI failures. None of them are. They’re context gaps and platform quirks.

That’s the pattern most debugging surfaces.

SPEAKER NOTES

Only land on this slide if your queue is light. If you have 5 real problems, skip past it.

If you use one, walk the situation, ask the room to diagnose, then reveal the pattern. Full write-ups are in the instructor guide — you should have skimmed scenarios A–C before class.

Land the through-line: **two of three are not AI failures. They’re context gaps and platform quirks.** That reframes everything.

Time on slide: only used if needed.

Synthesis — what did the room just learn?

5 minutes · group discussion before we move on

- What patterns repeated? (Most problems are context gaps, not frontier limits.)
- How many were “AI couldn’t” vs. “we didn’t tell it enough”?
- What questions should we ask the AI *differently* next time?
- Which problems belong on the frontier map?

Most debugging is one of three things: the AI didn’t have enough context, the platform has a quirk the AI doesn’t know about, or we hit a real frontier. Categories 1 and 2 we can fix. Category 3 goes on the map.

SPEAKER NOTES

5 minutes max. Walk the four questions briskly — you’re reinforcing the pattern, not opening a new discussion.

Read the pull-quote to close: **“Most debugging is one of three things...”** That sentence is what people will remember tomorrow.

Time on slide: 5 minutes (2:33-2:38). Aim to enter M4 at 2:38.

MODULE 4

Verification protocols and QA

30 minutes

A reference card you can hand to a junior Marine, plus a timed drill that proves you can spot what AI gets wrong.

SPEAKER NOTES

Brisk transition. **“Now we’re going to build the QA habit you can hand to a junior Marine.”**

Set the structure: 5 minutes on the reference card, 10 minutes silent drill, 10 minutes debrief.

Time on slide: 30 seconds.

QA reference card — the five protocols

This slide stays on screen for the discussion. Screenshot it.

PROTOCOL 1
Source verification

AI fabricates references. Every citation, regulation number, NAVMC form, and URL is independently verified against the official publication system. *If it can't be found, it's wrong.*

PROTOCOL 2
Data accuracy

Every number, date, name, rank, and quantity gets checked against source data. Spot-check at minimum. AI confidently uses plausible-but-wrong figures.

PROTOCOL 3
Logic check

Does the reasoning hold end to end? Are conclusions supported by the premises? Watch for steps in wrong order, contradictory timelines, and silent assumptions.

PROTOCOL 4
Format compliance

Does the output match required formats, templates, DTGs, and standards? AI loses formatting consistency in long documents — especially in numbered lists and procedures.

PROTOCOL 5 · THE ONE NOBODY CAN SKIP
Domain review

Does this pass the smell test for someone who actually does this work? Hand it to the SME before you sign it. The other four protocols are mechanical — this one is judgment, and it's the one AI can't do for you.

SPEAKER NOTES

This slide is designed to stay on screen for the entire discussion of the protocols and to get screenshotted. Tell people: “Take a screenshot of this. This is the artifact you give to a junior.”

Walk all five protocols. Spend extra time on Protocol 5 (domain review) — that’s the one nobody can skip and the one AI can’t do for you.

Cite the GDPval finding (1.4× faster, 1.6× cheaper with human review) once. **“The review step is where value is created.”**

Time on slide: 8 minutes total — 5 min walk-through + stays up during the drill that follows.

Find the five errors

10 minutes · silent · then 10-minute debrief

PROMPT

I'm sharing a one-page AI-generated SOP excerpt in chat now. Run it through all five protocols. Mark **every** issue you would not sign. Number them. There are **five planted errors**: two fabricated references, one contradictory timeline, one logic error, one format break. Find all five.

What good looks like: all five errors found in under 10 minutes, with the protocol number that caught each one. If you only find three, you're skipping a protocol — usually source verification, because it requires looking things up. *Looking things up is the protocol.*

SPEAKER NOTES

Drop the AI-generated SOP excerpt into chat as you start the timer. (The excerpt is in the instructor guide — copy it ahead of class.)

10 minutes silent. **Mute yourself.** Don't answer chat questions during the drill — that defeats it.

At 10 minutes: hard stop. Reveal the five planted errors one by one. Ask: "Which protocol caught it?"

If most of the room only found 3, name it kindly: "Three is the average — that's why the drill exists. Source verification requires actually looking the references up. **Looking things up is the protocol.**"

Time on slide: 10 min drill + 10 min debrief (2:38-2:58 if on time, drift OK).

MODULE 5

Teaching others — the 201 multiplier

30 minutes

You don't leave this room as a graduate. You leave as the person who teaches the next two Marines what you just learned.

SPEAKER NOTES

This is the slide where you change the energy. **“You don’t leave this room as a graduate. You leave as the person who teaches the next two Marines.”**

Set timing: 5 min framing + 5 min apprentice problem + 20 min teach-back exercise.

Time on slide: 30 seconds.

What you owe forward

The 201 multiplier · ties to the EDD train-the-trainer guidance

The owe

- You teach **two Marines** the 201 skills before your next PCS.
- You sit in on someone else's session and give one piece of feedback.
- You contribute one entry to the unit's frontier map per quarter.
- When you PCS, your replacement is certified before you walk.

Why it's on you

- Mollick: workers are using AI but hiding it. Shadow culture, no shared practice.
- Your job is to surface it, formalize it, and pass it on.
- Each unit needs **2 certified instructors** at all times — succession is your responsibility.
- Train-the-trainer pathway is in the EDD guidance: shadow → co-teach → deliver.

SPEAKER NOTES

Read the four owes out loud. They are concrete and personal — that's the point.

Cite the EDD train-the-trainer pathway directly: **shadow → co-teach → deliver**. Tell people they can register interest with the Program Coordinator after this course.

If you have specific train-the-trainer dates coming up at the unit, drop them in chat now.

Time on slide: 3 minutes.

The apprentice problem — and the four protocols

Entry-level postings dropped 35% in AI-exposed jobs from 2023-2025. If juniors never write the doc, how do they learn to spot when AI's draft is wrong?

What you do with juniors

- **Require review and explanation** — they have to defend *why* AI's output is right or wrong.
- **Periodically work without AI** — key tasks done from scratch monthly to keep the muscle.
- **Use AI output as a teaching tool** — hand them a flawed draft, have them find the issues.
- **Rotate them through QA** — the only way they build judgment is exposure to bad output.

What you don't do

- Skip the apprentice phase because AI is faster.
- Let juniors paste output directly into final products.
- Use AI to grade AI without a human in the loop.
- Assume the section will be fine if you stop developing the next generation.

SPEAKER NOTES

Lead with the stat (35% drop in entry-level postings). Don't belabor it — the room knows the labor market.

The four protocols on the left are practical and immediately usable. Ask: "Which of these are you already doing? Which are you not?" 2-3 chat answers max.

The right column is the "don't" list. Don't shame; just name the patterns.

Time on slide: 5 minutes. Move into the teach-back at ~3:08.

Teach one concept — 3 minutes

2 min pick • 5 min prep • 10 min round-robin in breakouts • 5 min debrief

PROMPT

Pick **one** concept from EDD: centaur vs. cyborg, frontier mapping, context-building, iterative refinement, verification protocols, the jagged frontier. Use the template: **one-sentence definition** • **why it matters** • **one real example from your job** • **one common mistake** • **one takeaway**. Then teach it in 3 minutes in your breakout room.

Peers grade you on three things: could they explain it back to someone else, was your example concrete enough to be believable, and do they know what to do differently tomorrow because of you. *Time-box hard. Brevity is the teaching skill.*

SPEAKER NOTES

Hard timebox — this one will sprawl if you let it. 2 min pick concept, 5 min prep silent, 10 min in breakouts (3 min per teach + 1 min feedback, rotate), 5 min full-room debrief.

Before sending to breakouts: **model the template yourself** with one filled-in example. The instructor guide has a centaur-vs-cyborg example you can read verbatim. People do better when they've seen the shape.

Use Teams breakout rooms of 3-4 people. 10-minute timer on the breakout. Pop into 1-2 rooms during.

When everyone returns: ask for one volunteer to teach to the full room (optional, but powerful) and give live feedback against the rubric. That's the teaching-of-teaching moment.

Time on slide: 22 minutes total (3:08-3:30, drifted 10 min behind agenda — absorb in M6 timing).

MODULE 6

Workflow playbook & wrap-up

30 minutes

One page. One recurring task. One AI-integrated workflow your section can run without you. The deliverable that proves you graduated.

SPEAKER NOTES

Brisk: **“One page. One workflow. The deliverable that proves you graduated.”**

Set timing: 5 min walk the example, 20 min silent build, 5 min reflection & close.

Time on slide: 30 seconds.

What a finished playbook looks like

Worked example · weekly training schedule publication

Task	Weekly training schedule for the section
Frequency & mode	Every Thursday by 1600 · Cyborg (continuous back-and-forth)
Steps (Human / AI)	1. H: Pull events from calendar, OPORD, taskings. 2. AI: Draft schedule in standard weekly format. 3. H: Cross-reference range bookings, vehicles, instructor availability. 4. AI: Format conflicts as a decision matrix with options. 5. H: Decide conflicts, add section leader notes. 6. AI: Generate the final formatted schedule for distribution.
Verification checklist	Every event has a confirmed location · all times in 24-hour · no double-bookings · uniform specified · POC listed.
Known frontier issues	AI invents room numbers · cannot check range availability · sometimes reverts to 12-hour time.
Time savings	~3 hours without AI → ~45 minutes with AI.
Junior development	Rotate schedule duty among juniors weekly. They brief why each event is scheduled. Once a month: schedule built without AI to keep the baseline skill.

SPEAKER NOTES

Walk one row of the example out loud — the **Steps** row is the one that shows what good looks like (numbered, H/AI labels, concrete actions).

Don't read every cell. Tell people: "Yours doesn't need to be this polished. Specific is more important than pretty."

Time on slide: 5 minutes.

Write your playbook — one page, one workflow

20 minutes · silent work · submit in chat by the timer

PROMPT

Pick a real, recurring task from your job. Fill the seven fields: **task · frequency & mode · 4-8 H/AI steps · verification checklist (3-5 items) · known frontier issues · time savings · junior development note**. It must be specific enough that a junior Marine could run it without you in the room.

Completion bar: 4+ steps, each labeled H or AI, a verification checklist with 3+ items, at least one real frontier issue you've hit, a time savings estimate from your own data, and a junior development note that's actionable. *If your playbook has no verification checklist, it isn't done.*

SPEAKER NOTES

20 minutes silent. Set the timer. Read the prompt once. Repeat the completion bar once.

Tell people to **submit their playbook in chat at the timer** — that creates a public commitment and lets you compile them after.

At 10 minutes: chat broadcast: **“Halfway. The verification checklist is the field people skip — make sure you have one.”**

At 18 minutes: “2 minutes left. If you're not done, submit what you have.”

Hard stop at 20. Move to reflection.

Time on slide: 20 minutes (3:30-3:50).

Reflection — before you close the laptop

3 prompts · drop one-line answers in chat

- What's the **one thing** from today you're going to do differently next week?
- Which of the six 201 skills did you feel **weakest** on today — and what's your plan?
- Who's the **first person** you're going to teach this to, and when?

I'll save the chat and send the synthesis to your section lead.

SPEAKER NOTES

3 minutes. Pure chat-driven. Don't read every chat answer out loud — let them be private notes-to-self.

If 1-2 striking answers come in, surface them: “[Name] said they’re going to teach this to their squad leader Friday. That’s the bar.”

Time on slide: 3 minutes.

Certification path — what it takes

Meets-or-better in 5 of 6 categories · recommended for instructor track

The six rubric categories

- Frontier map completeness (M1)
- Complex build & mode-switching (M2)
- Debugging contribution (M3)
- QA protocol rigor (M4)
- Teaching effectiveness (M5)
- Workflow playbook completeness (M6)

What “graduated” unlocks

- Serve as a **Platform Training instructor**.
- Lead tool-development projects in your unit.
- Mentor junior personnel in AI-assisted workflows.
- Contribute to frontier map and workflow playbook libraries.
- Path to QA reviewer → Advanced Workshop instructor.

Didn't hit the bar today? Build 1-2 more tools, attempt Advanced Workshop again. We'll keep the seat.

SPEAKER NOTES

Walk the 6 categories briefly — people have seen them throughout the day, this is just the recap.

The unlock list on the right is the why. Land hard on “**Path to QA reviewer → Advanced Workshop instructor.**”

Be honest about the “didn't hit the bar” line — nobody fails out, they re-attempt. We keep the seat.

Time on slide: 3 minutes.

Next week — Week 5: Supervisor Orientation

30 minutes · for leadership · you should encourage your chain to take it

What it covers

- How to evaluate AI tool proposals from your Marines.
- How to create a permission culture so people stop hiding their AI use.
- The apprentice problem — from the supervisor’s seat.
- What to ask in a 1-on-1 about AI work.

Your action item

- Forward the Week 5 invite to your section leadership today.
- Bring your frontier map to your next 1-on-1 with your supervisor.
- Submit your playbook to the unit registry by EOW.

Thank you. Now go teach somebody.

SPEAKER NOTES

Brief and warm. Tell them **Week 5 is for their leadership**, not for them — their action item is to forward the invite up the chain.

Land the closing line: **“Thank you. Now go teach somebody.”** Pause for 3 seconds before ending the meeting. People will type in the chat — honor that.

After class, instructor only: save the chat transcript, compile the playbooks people submitted, fold any new frontier findings into the unit map, and send the synthesis to section leads within 24 hours.

Time on slide: 2 minutes. Total runtime ~3:55. Buffer absorbed across the day. End on time.
